

N-Fix Soil Nutrient Concentrate, as we have mentioned before, is very unique, and the nature of the product is ideal for contaminated water, one of the issues that has been mentioned on 'Civilnet', partly due to dwindling water supplies.

N-Fix Soil Nutrient Concentrate will clean contaminated water 'in situ' in the micro-irrigation lines and 'ultra-fine' dripper systems, as shown in the included photos, where N-Fix Soil Nutrient Concentrate is used in-line with ground water used for horticulture and vegetable growing. N-Fix Soil Nutrient Concentrate has been extensively used in this way in Australia over many years, improving water quality, maximizing the efficiency of these systems according to their specifications, and cleaning any residue that may be in-line, without inhibiting water flow in these systems or irrigation heads.

Further, the nature of N-Fix Soil Nutrient Concentrate also drought-proofs both soil and crops.

No other fertiliser, including nitrifying bacteria based 'biofertiliser', other biofertilisers, chemical fertiliser or soil nutrient currently available in Armenia, or even Australia, can achieve all this. Such is the quality and nature of N-Fix Soil Nutrient Concentrate as a certified organic soil nutrient biofertiliser.

The prime growing season in Armenia is fast approaching, and the drought we believe is still prevalent, so these benefits are of utmost importance to the economic and agricultural wellbeing of Armenia.

Proud to be an Australian Manufacturer for over 39 years
